

The mailMAX Email Security Management service was reviewed by Network World and was designated a Clear Choice Test award winner. This recognition by an objective third party expert validates that mailMAX is one of the very best managed solutions available. Excerpts are outlined below and the complete contents of this review are available as indicated via the link identified.

“Top spam fighters offer feature diversity”

“Our short list, based on the spam catch tests, included three services—Postini, Advascan and **mailMAX**.”

“We looked at four key areas: spam-oriented features, per-user features, anti-virus and policy-based filtering, and logging and management.”

“**mailMAX** let you pick which [DNS] lists to look at and what weight to give them...the ability to adjust these features is critical.”

“While many network managers might not want to let end users play with their spam setting, the argument in favor of empowering them is strong. When users are in control, they are happier and having some black box filter their email without a way for them to control it doesn't go over well.”

“The most flexible were from MailFrontier, Messaging Architects, **mailMAX** and Postini. Each of these has group-level and user-level settings, and give the network manager the opportunity to expose those settings to users (if desired).”
